(54) Title: INTERNET-BASED TELEPHONE CALL MANAGER

(57) Abstract

A method is provided that allows data access service provider subscribers to manage their telephone service through a data connection. The subscriber is enabled to obtain call data information and is provided real-time control. During a data call, a visual incoming call indicator informs the subscriber, through a pop-up window, connected to the data access service provider that there is a call attempt. A visual message waiting indicator allows a subscriber, connected to the data access service provider to be notified of a pending message on the voice message system. A visual call disposition allows the subscriber, through the data connection, to dispose of calls. The call disposition options include forwarding a call to voice mail, playing an announcement to the calling party, forwarding the

call to another line, sending a text message which could be converted to speech using text to speech technology, answering the call using voice over data call or terminating the data connection in order to accept the call.

INTERNET-BASED TELEPHONE CALL MANAGER

Field Of The Invention

5 The present invention relates to handling
telephone related messages during data communications
sessions.

Background To The Invention

10 As a result of the increasing popularity of the
Internet and the World Wide Web, more and more users stay
connected to their Internet service provider, mainly
through dial-up modem connections, for durations well
15 exceeding the average holding time for voice calls (3
minutes). During these calls, the call waiting indicator
is usually disabled since the tone generated by this
feature would disrupt the data stream. Since the Internet
session in most cases occupies the only telephone line in
20 the house, the subscriber is neither able to detect nor
respond to a call attempt.

Summary Of The Invention

 It is an object of the present invention to
provide improved telephone call handling during data
25 communication sessions.

 According to one aspect of the present invention
there is provided a method of providing an indication of an
incoming call to a called station coupled to a
telecommunications network, the called station having a
30 data processing terminal engaged in a data call with a data
communications network, the data call being through a
connection in the telecommunications network to an access
gateway for the data network, the method comprising the
steps of providing a signal advising of the incoming call
35 from the access gateway, over the data call connection
through the telecommunications network, to the data
processing terminal and generating by the data processing

- 2 -

terminal, responsive to receiving the signal, an incoming call indication.

According to another aspect of the present invention there is provided a method of providing an indication of a message waiting at a voice messaging service to a called station coupled to a telecommunications network, the called station having a data processing terminal engaged in a data call with a data communications network, the data call being through a connection in the telecommunications network to an access gateway for the data network, the method comprising the steps of providing, by the telecommunications network, an incoming call intended for the called station to a voice messaging service whereby the incoming call may record a message, providing a signal advising of the message waiting from the access gateway, over the data call connection through the telecommunications network, to the data processing terminal and generating by the data processing terminal, responsive to receipt of the signal, the message waiting indication.

According to a further aspect of the present invention there is provided a method of disposing of an incoming call intended for a called station coupled to a telecommunications network, the called station having a data processing terminal engaged in a data call with a data communications network, the data call being through a connection in the telecommunications network to an access gateway for the data network, the method comprising the steps of holding call processing of the incoming call at a switching system in the telecommunications network, providing a signal advising of the incoming call from the access gateway, over the data call connection through the telecommunications network, to the data processing terminal, receiving from the data processing terminal, via the access gateway, instructions for disposing of the incoming call and continuing the call processing of the incoming call at the switching system according to the received instructions.

- 3 -

According to an additional aspect of the present invention there is provided a system for interconnecting a telecommunications network and a data communications network, comprising a telecommunications gateway and a data network gateway adapted to interface the telecommunications network and the data network, one or more stations coupled to the telecommunications network, each station having a data terminal and a telephone terminal, means for recognizing, responsive to an incoming call being directed to a particular station, that the data terminal of the particular station has a data call connection through the telecommunications network to the data network and means for signalling information relating to the incoming call from the telecommunications network, via the telecommunications and data network gateways, over the data call connection to the data terminal of the particular calling station.

According to a still further aspect of the present invention there is provided a method of managing telephone service to a called station coupled to a telecommunications network while the called station is engaged in a data call, the method comprising the steps of providing a message indicative of an incoming call to the called station via the data call, accepting a message from the called station via the data call and disposing of the incoming call in response to the accepted message.

The present invention has the advantage of allowing a subscriber to monitor and control telephone services while engaged in a data call, via the data call.

The basic concept behind the present invention is to combine the Public Switched Telephone Network (PSTN) and the Internet service providers' enhanced signalling and data communication capabilities to provide incoming call information and control to an Internet subscriber. With the Internet Call Manager, the subscriber is informed of call attempts and can dispose of the call as deemed appropriate. Furthermore, subscribers connected by modem

- 4 -

cannot check if they have pending messages without terminating their session. The visual message waiting indicator allows them to be informed of their mailbox status within their Internet session.

5

Terminology and acronyms

- Caller

Person that calls the subscriber. The caller can reach the subscriber in two ways, either directly, i.e., the caller dials the subscriber's DN, or indirectly, i.e., the caller dials a DN that is forwarded to the subscriber's DN.

10

- Data Access Service Provider (DASP)

Data network operator that sells access services to its data network that allows the subscribers to communicate through the DASP's network and other data networks.

15

- DASP user

Person that subscribes to and uses DASP services.

- Forwarding from station number (FF)

Parameter conveyed over the control between the PSTN and the VMS system and used by the VMS system as the mailbox identifier.

20

- Subscriber

A DASP user that subscribes also to the Call Manager service.

25

- VMS subscriber

Person that subscribes to a VMS.

Acronyms

- BRI - Basic Rate Interface
- CPE - Customer Premise Equipment
- DASP - Data Access Service Provided
- DN - Directory Number
- ICM - Internet Call Manager
- ISDN - Integrated Services Digital Network
- ISP - Internet Service Provider
- MWI - Message Waiting Indicator

35

- 5 -

- PSTN - Public Switched Telecommunication Network
- SMDI - Simplified Message Desk Interface
- SS7 - Signalling System #7
- VMS - Voice Messaging Service
- 5 • VMS-SP - VMS Service Provider

An advantage of the method of the present invention is allowing data access service providers (DASP) subscribers to manage their telephone service through their
10 DASP connection. The subscriber can obtain call data information and provides real time call control.

The service in accordance with an embodiment of the present invention has the following components.

A Visual Incoming Call Indicator (VICI) informs a
15 subscriber through a popup window connected to the DASP that there is a call attempt. When available the user could be provided with the CLID and the calling name. Another version of this feature could inform the subscriber of a call attempt through Email.

20 A Visual Message Waiting Indicator (VMWI) allows a subscriber connected to the DASP to be notified of pending message on the VMS through a convenient screen display.

A Visual Call Disposition (VCD) allows the subscriber through the DASP connection to dispose of the
25 calls following a visual incoming call indication. The subscriber can optionally:

- forward the call to voice mail
- play an announcement (perhaps personalized)
- forward the call to another line
- 30 • send a text message which would be read using text to speech technology
- answer the call using voice over Internet
- terminate or park the Internet connection and take the call.

35 A method in accordance with the present invention introduces the concept of combining the Public Switched

- 6 -

Telephone Network (PSTN) and Data Access Service Provider (DASP) enhanced signalling and data communication capabilities to provide incoming call information and control to a DASP subscriber.

5 In the following descriptions, specific instances of the PSTN enhanced signalling capabilities are used for the purpose of describing the concept. However, those skilled in the art will recognize that the scope of this invention is not limited to these specific instances. To
10 ease description, functional call flows are used.

Brief Description Of The Drawings

The present invention will be further understood from the following description with reference to the drawings in which:

15 Fig. 1 illustrates an overview of a network in which the method in accordance with the present invention can be used;

Figs. 2 and 3 graphically illustrate the call-indication functional flow in accordance with another
20 embodiment of the present invention;

Fig. 4 graphically illustrates the call-indication functional flow in accordance with a further embodiment;

Fig. 5 graphically illustrates the message waiting indication functional flow in accordance with a further
25 embodiment of the present invention;

Fig. 6 graphically illustrates the message waiting indication functional flow in accordance with an additional embodiment of the present invention;

30 Figs. 7 and 8 graphically illustrate the incoming call disposition functional flow in accordance with a still further embodiment of the present invention.

Detailed Description

Referring to Fig. 1 there is provided a view of the network components and interfaces required by this
35 method. The network components are grouped into four (4) domains, i.e., the PSTN domain, the DASP domain, the Voice Message Service - Service Provider (VMS-SP) domain and the

- 7 -

Customer Premise Equipment (CPE) domain. The PSTN domain network components are the SS7-capable telecommunication switches, labelled Service Switching Point (SST) [1, 2, 3], the Public Switched Telephone Network, labelled PSTN [5], the PSTN Gateway Agent, labelled GA [19] and the PSTN gateway, labelled PSTN-G[4]. The DASP domain network components are the DASP gateway, labelled DASP-G[7] and the DASP data network [6]. The VMS-P[11] and the VMS gateway, labelled VMS-G[12]. For conciseness, the VMS gateway [5] is shown as being part of the VMS-SP domain. However, depending on the implementation, the VMS gateway [5] component may be outside of the VMS-SP domain and be part of the PSTN domain. The CPE domain components are the caller's telephone [10], the DASP subscriber's telephone [9] and computer [8] and the CPE gateway, labelled CPE-G [18].

In Fig. 1, interfaces [9, 10, 11, 12, 13, 20], shown as direct link between network components and functions, illustrate the logical relationships between these components and functions and as such, have no implications on the physical paths, either direct or indirect, and signalling supports used in the different implementations of this invention.

The PSTN gateway (PSTN-G) [4] is the PSTN component that implements the PSTN-DASP signalling. Through interface [12], the PSTN gateway provides the DASP gateway with the incoming call indication and control for all registered subscribers [17]. Via interface [11], the PSTN gateway mediates with the other PSTN network components, including but not limited to the SSPs [1, 2, 3], the PSTN Gateway Agent [19] through interface [20] and the VMS-SP's VMS gateway [5] through interface [13], to obtain the incoming call information, the MWI information and to remotely control call establishment in the case of call disposition service, for incoming calls to subscriber [17].

- 8 -

The PSTN Gateway Agent (GA) [19] is the PSTN component that provides the PSTN-G [4] with the incoming call information and remote call control for incoming calls to registered subscribers [17].

5 The VMS-SP's VMS gateway's (VMS-G) [5] responsibility is to provide the PSTN gateway [4] with the MWI information for registered subscribers [17].

 The DASP gateway (DASP-G) [6] is the DASP component that implements the PSTN-DASP signalling.
10 Through interface [12], the DASP gateway obtains from the PSTN gateway [4] the incoming call indication and control for all registered subscribers [17]. The main responsibility of the DASP gateway is then to mediate, through interface [9], DASP data network [8] and interface
15 [10], with the subscriber's [17]. For call disposition service, the CPE gateway receives the subscriber's inputs from the HMI and translates the call disposition request in the appropriate message format for delivery to the DASP gateway [6].

20 The above components can be implemented in various ways. A single component can be implemented as a stand-alone network equipment, multiple components can be combined in a single network equipment or a given component can be partitioned over two (2) or more network equipments.

25 In the following sections, methods and systems are described which implement the service components of this invention, namely, call indication, MWI delivery and call disposition. However, the scope of this invention is not limited to these implementations, which are merely
30 illustrative. Finally, for each service component, a specific service scenario issued for simplicity of description only. The invention is not limited to these service scenarios.

 The following data is used in the functional
35 flows:

- caller's DN is Dnc
- caller's name is Name_c

- 9 -

- subscriber's DN is Dns
- subscriber's Name is Name_s
- DASP gateway's DN is Dng (where applicable)
- VMS's DN is Dnv.

5

Incoming call indication

Referring to Figs. 2 and 3 there is provided a detailed functional flow for a specific implementation of the call indication service component. The following service scenario is used in the functional flow for description purposes only, the method not being limited to this service scenario:

- the subscriber subscribes to a VMS
- the subscriber's telephone line is busy due to a dial-up data session to the DASP.
- all calls are interswitch.

In this implementation of the invention, the GA[19] is implemented using the AIN call model on SSP[2]. The PSTN-G[4] component could be implemented in many ways, including but not limited to an Advanced Intelligent Network (AIN) Service Control Point (SCP) an SS7 protocol analyzer and an SS7 mediation point. The PSTN signalling capabilities used are the Signalling System #7 (SS7) Transaction Capability Application Part (TCAP) as interfaces [11], [12] and [20].

The AIN call model GA [19] at the subscriber's [17] SSP [2] is used to detect incoming calls to subscriber's DN, using, for example, the AIN Termination_Attempt trigger. It communicates with the PSTN-G[4] using the SS7-based AIN SSP-t-SCP protocol as interfaces [11] and [20]. Upon incoming call to subscriber [17], the SSP [2] AIN Termination_Attempt trigger gets fired and sends incoming call information, including the caller's [15] DN and name, to the PSTN-G[4], using, for example, the AIN Termination_Attempt message, in which case the PSTN-G[4] could answer with an Authorize_Termination

- 10 -

message. The PSTN-G[4] can then provide the DASP-G[6] with the required incoming call indication information. The DASP G[6], through a standard data communication protocol, including but not limited to TCP/IP, HTTP and FTP, communicates the information to the CPE-G[18]. This information is then formatted and displayed to the user.

The terms used are:

- TA: AIN Termination_Attempt trigger
- 10 • TA: AIN Termination_Attempt SSP-SCP message
- A_T: AIN Authorize_Termination SCP-SSP message
- IAM: SS7 ISUP Initial Address Message
- ACM: SS7 ISUP Address Complete Message
- ANM: SS7 ISUP Answer Message
- 15 • FF: SMDI Forwarded From number
- CdPN: Called Party Number parameter
- CgPN: Calling Party Number parameter
- CgName: Calling Party Name parameter
- OCN: Originally Called Number parameter
- 20 • RDI: Redirecting Indicator parameter
- RDN: last Redirecting Number parameter
- RgName: Redirecting Name parameter

Other implementations of this method to deliver the call indication service component are possible. They include but are not limited to the following one. Referring to Fig. 4 there is illustrated an embodiment of the present method. In this implementation of the invention, the GA[19] is implemented using the SSP-based [2] Call Forward Busy (CFB) telephony feature, the PSTN[4] component is implemented by a PSTN SSP and the PSTN signalling capabilities used are:

- the Signalling System #7 (SS7) Integrated Services Digital Network User Park (ISUP) as interface [11] and [20]
- 35 • the Integrated Services Data Network - Basic Rate interface (ISDN-BRI) as interface [12]

- 11 -

- the Simplified Message Desk Interface (SMDI) for PSTN to VMS system signalling.

Terms used are:

- Setup: ISDN BRI call Setup message
- 5 • Alert: ISDN BRI Alert message
- Rel: ISDN BRI Release message
- CRn ISDN BRI Call Reference number n
- CFB: PSTN Call Forward Busy Feature
- CFD: PSTN Call Forward Don't Answer feature
- 10 • T_cfd: CFD timer

Message Waiting Indicator (MWI) delivery

Referring to Fig. 5, there is illustrated a detailed functional flow for a specific implementation of the MWI delivery service component. The following service scenario is used in the functional flow in Fig. 5 for description purposes only, the method not being limited to this service scenario:

- the subscriber subscribes to the VMS.
- 20 • the subscriber's telephone line is busy due to a dial-up data session to the DASP.
- all calls are interswitch
- a message for the DASP subscriber [17] has just been left at VMS-P[14].

25 In the embodiment of the invention of Fig. 5, the VMS-G (voice messaging service gateway) [5] is implemented using the AIN call model on SSP [2]. The PSTN-G [4] component is as discussed with regard to Figs. 3 and 4. Incoming call indication, could be implemented in many ways, including but not limited to an AIN Service Control Point (SCP). The PSTN signalling capabilities used are the Signalling System #7 (SS7) Transaction Capability Application Part (TCAP) as interfaces [11], [12] and [13].

35 The AIN non-call associated capability VMS-G [5] at the subscriber's [17] DN. The PSTN-G[4] and the VMS-G[5] communicates using the SS7-based AIN SSP-to-SCP

- 12 -

protocol as interfaces [11] and [13]. A possibility is for the PSTN-G[4], when an incoming call has been detected using method described in regard to Figs. 2 and 3. Incoming call indication, to start a timer set at the subscriber's [17] maximum allowed message length. At time-out, PSTN-G [4] sends an AIN non-call related Query_Request to SSP [2] requesting for status of subscriber's [17] MWI. SSP [2] answers with the AIN Query_Response with an on/off activation status code parameter. The PSTN-G[4] then provides the DASP-G [6] with the MWI information if necessary. The DASP-G [6], through a standard data communication protocol, including but not limited to TCP/IP, HTTP and FTP, communicates the information to the CPE-G [18]. This information is then formatted and displayed to the user.

The terms used are:

- Q_Req: SS7 AIN
- QUERY_REQUEST SCP-SSP message
- 20 • Q_Resp: SS7 AIN Query_Response SSP-SCP message
- P_I: AIN Provide_Info parameter
- I_P: AIN Info-Provided parameter

Other implementations of this method to delivery the MWI delivery service component are possible. They include but are not limited to the following one.

Referring to Fig. 6 there is illustrated an additional embodiment of the present invention, the VMS-G [5] component is implemented as an SMDI monitoring tool, the PSTN-G [4] component is implemented by a PSTN SSP and the PSTn signalling capabilities used are:

- the Signalling System #7 (SS7) Transaction Capability Application Part (TCAP) as interfaces [11] and [13]
- the Integrated Services Data Network - Basic Rate Interface (ISDN-BRI) as interface [12]
- 35 • the Simplified Message Desk Interface (SMDI) for PSTN to VMS system signalling.

- 13 -

It shall be noted here that the parameter content of the TCAP messages used on interfaces 11 and 13 are not standard but adaptation of the NT proprietary TCAP messaging used to convey the MWI information.

5

The terms used are:

- QWP: SS7 TCAP Query with Permission package type
- Info: ISDN BRI Information message
- FI: ISDN BRI Feature Identification information element
- Incoming call disposition

10

Referring to Figs. 7 and 8 there is illustrated a detailed functional flow for a specific implementation of the incoming call disposition service component. The following service scenario is used in the functional flow for description purposes only, the method being not limited to this service scenario:

15

- the subscriber's telephone line is busy due to a dial-up data session to the DASP
- all calls are interswitch
- the subscriber decides to take the call and hence, selects the Take Call call disposition option.

20

In this implementation of the invention, the GA [19] is implemented using the AIN call model on SSP [2]. The PSTN-G [4] component could be implemented in many ways, including but not limited to an Advanced Intelligent Network (AIN) Service Control Point (SCP). The PSTN signalling capabilities used are the Signalling System #7 (SS7) Transaction Capability Application Part (TCAP) as interfaces [11], [12] and [20].

25

30

It shall be noticed that ALL the signalling over interfaces [12] and [9, 10] do not make reference to any existing protocol. It is provided only for sake of clarity of the whole process.

35

The terms used are:

- IAM: SS7 ISUP Initial Address Message

- 14 -

- TAT: AIN Termination_Attempt trigger
- T_A: AIN Termination_Attempt SSP-SCP message
- S_t-R: AIN Send_To_Resource SCP-SSP message
- C_R_E: AIN Cancel_Resource_Event SCP-SSP message
- 5 • R_C: AIN Resource_Clear SSP-SCP message
- A_T: AIN Authorize_Termination SCP-SSP message

As discussed above with regard to Figs. 2 and 3:
Incoming call indication, the AIN call model on SSP [2]
detects incoming calls to subscriber's DN using the
10 Termination_Attempt trigger. The AIN call model also
provides the remote call control capability required by the
PSTN-G to control call establishment as required by the
call disposition service component. To prevent situations
where the caller hangs up for waiting too long, the
15 subscriber [17] has a limited time windows (Call_Disp_Timer
expires, a default treatment is provided (e.g., route to
VMS). Finally, the other options of the call disposition
service component (route to DN, route to VMS, route to
announcement, route to canned messages, ...) can be
20 implemented using the AIN Forward_Call PSTN-G[4] response
to the SSP instead of the Authorize_Termination response.

Those skilled in the art will recognize that
various modifications and changes could be made to the
invention without departing from the spirit and scope
25 thereof. It should therefor be understood that the claims
are not to be considered as being limited to the precise
embodiments set forth above, in the absence of specific
limitations directed to each embodiment.

- 15 -

THE EMBODIMENTS OF THE INVENTION IN WHICH AN EXCLUSIVE
PROPERTY OR PRIVILEGE IS CLAIMED ARE DEFINED AS FOLLOWS:

1. A method of providing an indication of an incoming
5 call to a called station coupled to a telecommunications
network, the called station having a data processing
terminal engaged in a data call with a data communications
network, the data call being through a connection in the
telecommunications network to an access gateway for the
10 data network, the method comprising the steps of:
 providing a signal advising of the incoming call
from the access gateway, over the data call connection
through the telecommunications network, to the data
processing terminal; and
15 generating by the data processing terminal,
responsive to receiving the signal, an incoming call
indication.
2. A method as claimed in claim 1, wherein the signal
20 is a message including information relating to the incoming
call.
3. A method of providing an indication of a message
waiting at a voice messaging service to a called station
25 coupled to a telecommunications network, the called station
having a data processing terminal engaged in a data call
with a data communications network, the data call being
through a connection in the telecommunications network to
an access gateway for the data network, the method
30 comprising the steps of:
 providing, by the telecommunications network, an
incoming call intended for the called station to a voice
messaging service whereby the incoming call may record a
message;
35 providing a signal advising of the message waiting
from the access gateway, over the data call connection

- 16 -

through the telecommunications network, to the data processing terminal; and

generating by the data processing terminal, responsive to receipt of the signal, the message waiting
5 indication.

4. A method as claimed in claim 3, wherein the signal is a message including information relating to the incoming call.

10

5. A method as claimed in claim 4, wherein the message includes information relating to the recorded message.

15 6. A method of disposing of an incoming call intended for a called station coupled to a telecommunications network, the called station having a data processing terminal engaged in a data call with a data communications network, the data call being through a connection in the
20 telecommunications network to an access gateway for the data network, the method comprising the steps of:

holding call processing of the incoming call at a switching system in the telecommunications network;

25 providing a signal advising of the incoming call from the access gateway, over the data call connection through the telecommunications network, to the data processing terminal;

30 receiving from the data processing terminal, via the access gateway, instructions for disposing of the incoming call; and

continuing the call processing of the incoming call at the switching system according to the received instructions.

35 7. A system for interconnecting a telecommunications network and a data communications network, comprising:

- 17 -

a telecommunications gateway and a data network gateway adapted to interface the telecommunications network and the data network;

one or more stations coupled to the
5 telecommunications network, each station having a data terminal and a telephone terminal;

means for recognizing, responsive to an incoming call being directed to a particular station, that the data terminal of the particular station has a data call
10 connection through the telecommunications network to the data network; and

means for signalling information relating to the incoming call from the telecommunications network, via the telecommunications and data network gateways, over the data
15 call connection to the data terminal of the particular calling station.

8. A method of managing telephone service to a called station coupled to a telecommunications network while the
20 called station is engaged in a data call, the method comprising the steps of:

providing a message indicative of an incoming call to the called station via the data call;

accepting a message from the called station via
25 the data call; and

disposing of the incoming call in response to the accepted message.

9. A method as claimed in claim 8 wherein the message
30 indicative of an incoming call is an advanced intelligent network (AIN) message.

10. A method as claimed in claim 8 wherein the message
35 indicative of an incoming call is a signalling system #7 message.

- 18 -

11. A method as claimed in claim 8 wherein the message indicative of an incoming call is an ISDN message.

12. A method as claimed in claim 8 wherein the message
5 indicative of an incoming call is a call waiting indication.

13. A method as claimed in claim 8 wherein the message
10 indicative of an incoming call is a voice message indication.

14. A method as claimed in claim 8 wherein the step of disposing of the incoming call includes forwarding the call to voice mail.
15

15. A method as claimed in claim 14 wherein the step of disposing of the incoming call includes playing an announcement to the calling party.

20 16. A method as claimed in claim 14 wherein the step of disposing of the incoming call includes forwarding the call to another line.

17. A method as claimed in claim 14 wherein the step
25 of disposing of the incoming call includes sending a text message.

18. A method as claimed in claim 14 wherein the step of disposing of the incoming call includes answering the
30 call using voice over the data call.

19. A method as claimed in claim 14 wherein the step of disposing of the incoming call includes terminating the data call and accepting the incoming call.
35

- 19 -

20. A method as claimed in claim 14 wherein the step of disposing of the incoming call includes parking the data call and accepting the incoming call.

INTERNATIONAL SEARCH REPORT

Internat Application No

PCT/CA 97/00570

A. CLASSIFICATION OF SUBJECT MATTER

IPC 6 H04M3/42 H04M3/00 H04M3/50

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC 6 H04M

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	US 5 533 110 A (PINARD DEBORAH L ET AL) 2 July 1996 see column 6, line 11 - column 7, line 8 see figures 1,8	1,2,6,8, 12
Y	"WORKSTATION COMMUNICATIONS SYSTEM" IBM TECHNICAL DISCLOSURE BULLETIN, vol. 37, no. 9, 1 September 1994, pages 101-104, XP000473347 see the whole document	3-5
Y	WO 95 18501 A (GTE LABORATORIES INC) 6 July 1995 see the whole document	3-5

☒ Further documents are listed in the continuation of box C.☒ Patent family members are listed in annex.

* Special categories of cited documents:

"A" document defining the general state of the art which is not considered to be of particular relevance

"E" earlier document but published on or after the international filing date

"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another claim or other special reason (as specified)

"O" document referring to an oral disclosure, use, exhibition or other means

"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance: the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance: the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

"Δ" document member of the same patent family

Date of the actual completion of the international search

16 December 1997

Date of mailing of the international search report

30/12/1997

Name and mailing address of the ISA

European Patent Office, P.B. 5818 Patentlaan 2
